- L3 ANSWER 1 OF 16 CAPLUS COPYRIGHT 2002 ACS
AB Major brassinosteroid (BR) effects such as BR-induced growth are mediated through genomic pathways because RNA synthesis inhibitors and protein synthesis inhibitors interfere with these processes. A limited no. of BR-regulated genes have been identified hitherto. The majority of genes (such as BRU1, CycD3, Lin6, OPR3, and TRIP-1) were identified by comparisons of BR-treated vs. control-treated plants. However, altered transcript levels after BR application may not reflect normal physiol. events. A complementary approach is the comparison of BR-deficient plants vs. wild-type plants. No artificial treatments interfere with endogenous signaling pathways, but a subset of phenotypic alterations of phytohormone-deficient plants most probably is secondary. To identify genes that are subject to direct BR regulation, we analyzed CPD antisense and dwf1-6 (cbb1) mutant plants. Both show a mild phenotype in comparison with BR-deficient mutants such as cpd/cbb3, det2, and **dwf4**. Plants were grown under two different environments to filter out BR deficiency effects that occur only at certain environmental conditions. Finally, we established expression patterns after BR treatment of

wild-type and dwf1-6 (cbb1) plants. Ideally, a BR-regulated gene displays a dose-response relationship in such a way that a gene with decreased transcript levels in BR-deficient plants is BR inducible and vice versa. Expression profile anal. of above ground part of plants was performed by means of Affymetrix Arabidopsis Genome Arrays.

L3 ANSWER 2 OF 16 CAPLUS COPYRIGHT 2002 ACS DUPLICATE 1
AB Brassinosteroids (BRs) are essential regulators of growth and development. BR-deficient mutants such as cpd/cbb3 and dwf4 display extreme dwarfism due to a failure in cell elongation. To avoid the severe pleiotropic effects caused by the extreme growth defect, transgenic Arabidopsis lines carrying a construct for antisense inhibition of CPD gene expression were established and subjected to physiol. anal. The CPD-antisense (.alpha.-CPD) lines display characteristic phenotypic alterations of BR-deficient plants such as reduced stem and petiole growth, smaller leaves, and a slightly delayed development. The obsd. changes are intermediate between the corresponding loss-of-function mutant (cbb3) and wild-type plants. In the present study, the primary carbon metab. of the transgenic lines as well as the BR-deficient cbb1 (dwf1-6/dim) mutant was analyzed. Gas exchange measurements indicated a reduced assimilatory capacity of the .alpha.-CPD plants. Soil-grown .alpha.-CPD as well as cbb1 (dwf1-6) mutant plants show a clear redn. in starch content. The metabolic alterations are accompanied by altered enzyme activities such as reduced invertase and cytosolic .beta.-amylase activity, and altered expression patterns of genes such as Athfruct1, Asu1, and ct-Bmy (encoding a cell wall invertase, sucrose synthase, and plastidic .beta.-amylase, resp.). The impaired carbon assimilation, as well as the altered enzyme activities and gene expression patterns in the .alpha.-CPD and cbb1 (dwf1-6) plants, demonstrate the necessity of normal CPD and DIM expression for proper carbon uptake and metab. and may point to an essential function of BRs. The impaired growth of BR-deficient plants may be (at least in part) due to reduced photosynthesis.

L3 ANSWER 10 OF 16 AGRICOLA DUPLICATE 5
AB **dwarf4** (**dwf4**) mutants of Arabidopsis display a dwarfed
phenotype due to a lack of cell elongation. Dwarfism could be rescued by
the application of brassinolide, suggesting that **DWF4** plays a
role in brassinosteroid (BR) biosynthesis. The **DWF4** locus is
defined by four mutant alleles. One of these is the result of a T-DNA
insertion. Plant DNA flanking the insertion site was cloned and used as a
probe to isolate the entire **DWF4** gene. Sequence analysis
revealed that **DWF4** encodes a cytochrome P450 monooxygenase with
43% identity to the putative Arabidopsis steroid hydroxylating enzyme
CONSTITUTIVE PHOTOMORPHOGENESIS AND DWARFISM. Sequence analysis of two
other mutant alleles revealed deletions or a premature stop codon,
confirming that **DWF4** had been cloned. This sequence similarity
suggests that **DWF4** functions in specific hydroxylation steps
during BR biosynthesis. In fact, feeding studies utilizing BR
intermediates showed that only 22 alpha-hydroxylated BRs rescued the
dwf4 phenotype, confirming that **DWF4** acts as a 22
alpha-hydroxylase.

L10 ANSWER 3 OF 29 CAPLUS COPYRIGHT 2002 ACS
 AB The present invention provides a pea cDNA mol. encoding a cytochrome P 450 that catalyzes the **brassinosteroid** (BR) biosynthesis through C-2 hydroxylations in **plants**. The encoded amino acid sequence of the cytochrome P 450 is also provided. The small G protein Pra2 specifically interacts with the cytochrome P 450. The P 450 is dark-inducible and predominantly expressed in the rapidly elongating region of the epicotyls, like the Pra2. The Pra2 and cytochrome P 450 proteins are colocalized to endoplasmic reticulum (ER). The authors named the cytochrome P 450 as DDWF1 (Dark-induced DWF-like protein 1). **Transgenic plants** with reduced Pra2 exhibits dwarfish hypocotyls in the dark, which is completely rescued by BR but not by other growth hormones. The cytochrome P 450 DDWF1 mediates multiple 0-2 hydroxylations in the BR biosynthesis. **Transgenic plants** overexpressing the cytochrome P 450 show elongated stems even in the light, which phenocopies the hypocotyls of dark-grown seedlings. These results indicate that the Pra2 is a light-regulated mol. switch that regulates the hypocotyl elongation in etiolated seedlings through interaction with the cytochrome P 450 DDWF1. The cytochrome P 450 DDWF1 exhibits a C-2 hydroxylase activity that is specific to the conversions from typhasterol to castasterone and from 6-deoxotyphasterol to 6-deoxocastasterone. The invention also describes the methods and processes for generating expression cassettes and plasmids and for the use of these expression cassettes and plasmids to synthesize the cytochrome P 450 DDWF1 or biol. active fragments of such an enzyme. The invention can be utilized to improve or decrease the stem growth of **transgenic plants** contg. the nucleic acid mol. so that they exhibit improved growth rate and resistance to environmental stress and to identify other proteins involved in the **brassinosteroid** biosynthesis and in the **plant** growth regulation.
